

# Quo Vadis Information Retrieval Research

Kal Järvelin  
University of Tampere

# Agenda

- 1. Introduction
- 2. Some Concepts
- 3. The Laboratory Approach to IR
- 4. Mounting Critical Evidence
- 5. Cognitive Framework for Research on IIR
- 6. Concluding Discussion

# 1. Introduction

- IR theory?
  - SIGIR theory = Formal Retrieval Models
  - Not really empirical theories to be confirmed or refuted
  - Are there other types of theories?
- What theories are we trying to construct?

# Motivation

- The ultimate goal of information retrieval is support humans to better access information in order to carry out their task.

# Agenda

- ✓ 1. Introduction
- 2. **Some Concepts**
- 3. The Laboratory Approach to IR
- 4. Mounting Critical Evidence
- 5. Cognitive Framework for Research on IIR
- 6. Conclusions

## 2. Concepts : Frameworks, Models

- Frameworks in research
  - Essential objects to study
  - The relationships of objects
  - The changes in the objects / relationships that affect the functioning of the system
  - Promising goals and methods of research
- The concept model
  - A precise (often formal) representation of objects and relationships (or processes) within a framework
  - Modeling may also in principle encompass human actors and organizations

# Hypotheses, Laws, Theories

- Variables
  - represent objects etc.
  - are used in hypotheses, laws ...
- Hypotheses
  - state verifiable facts / relationships whose truth is unknown.
- Scientific laws
  - empirical laws express verified relationships between objects, properties or events
- Theories
  - systematic collections of theoretical and empirical laws

# Variables

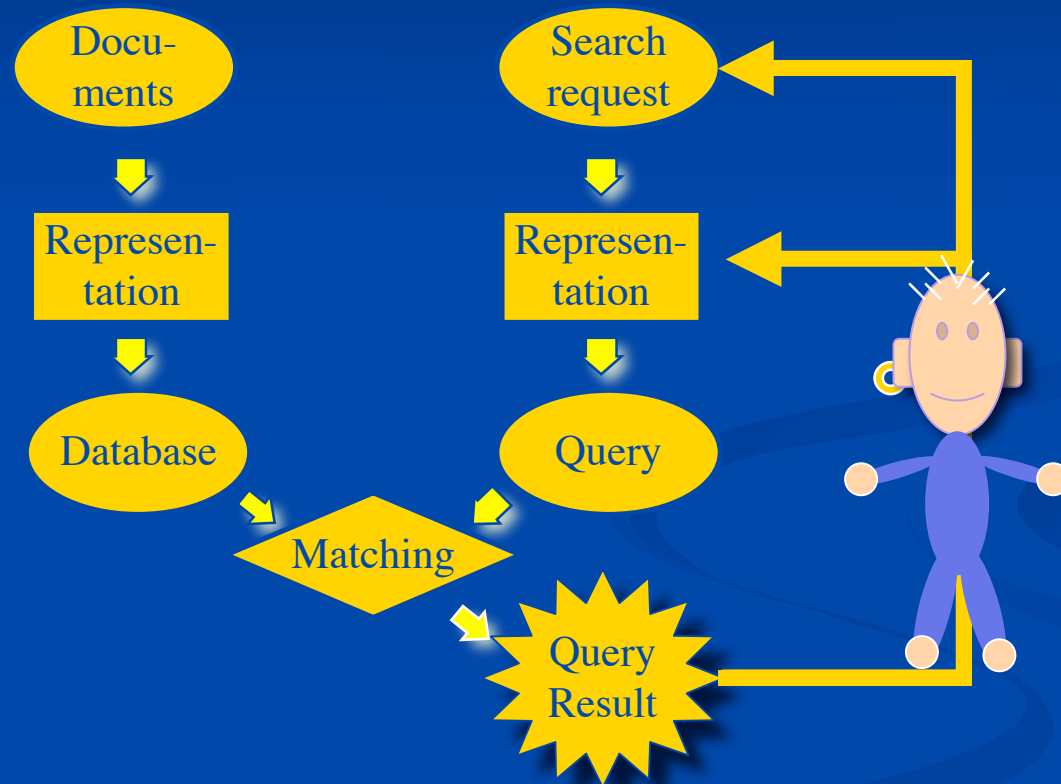

- Types of variables in study designs:
  - dependent variables – the variation of which is explained
  - independent variables – the ones systematically varied in order to see the responses in the dependent ones
  - controlled variables – the ones fixed to prevent uncontrolled variation in the results
  - hidden variables – all other variables

# Agenda

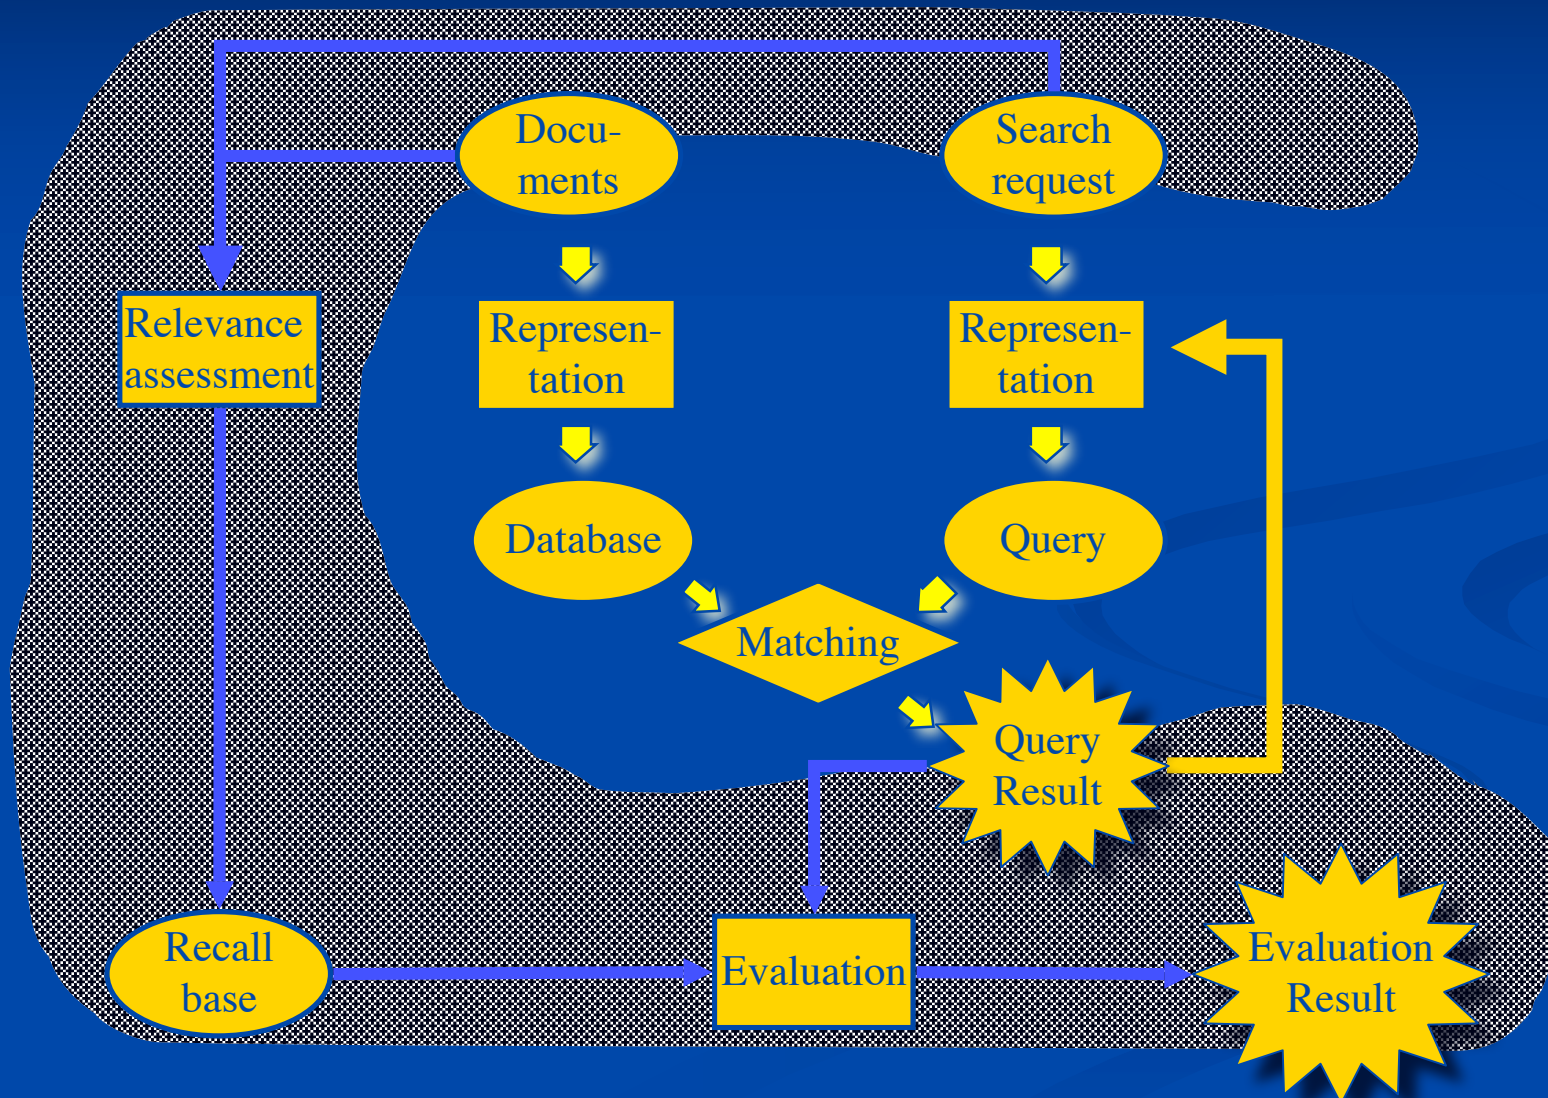

- ✓ 1. Introduction
- ✓ 2. Some Concepts
- 3. *The Laboratory Approach to IR, ltd.*
  - The Framework and Model(s)
  - Variables, Hypotheses, Laws and Theories
- 4. Mounting Critical Evidence
- 5. Cognitive Framework for Research on IIR
- 6. Conclusions

# 3. The Laboratory Approach to IR

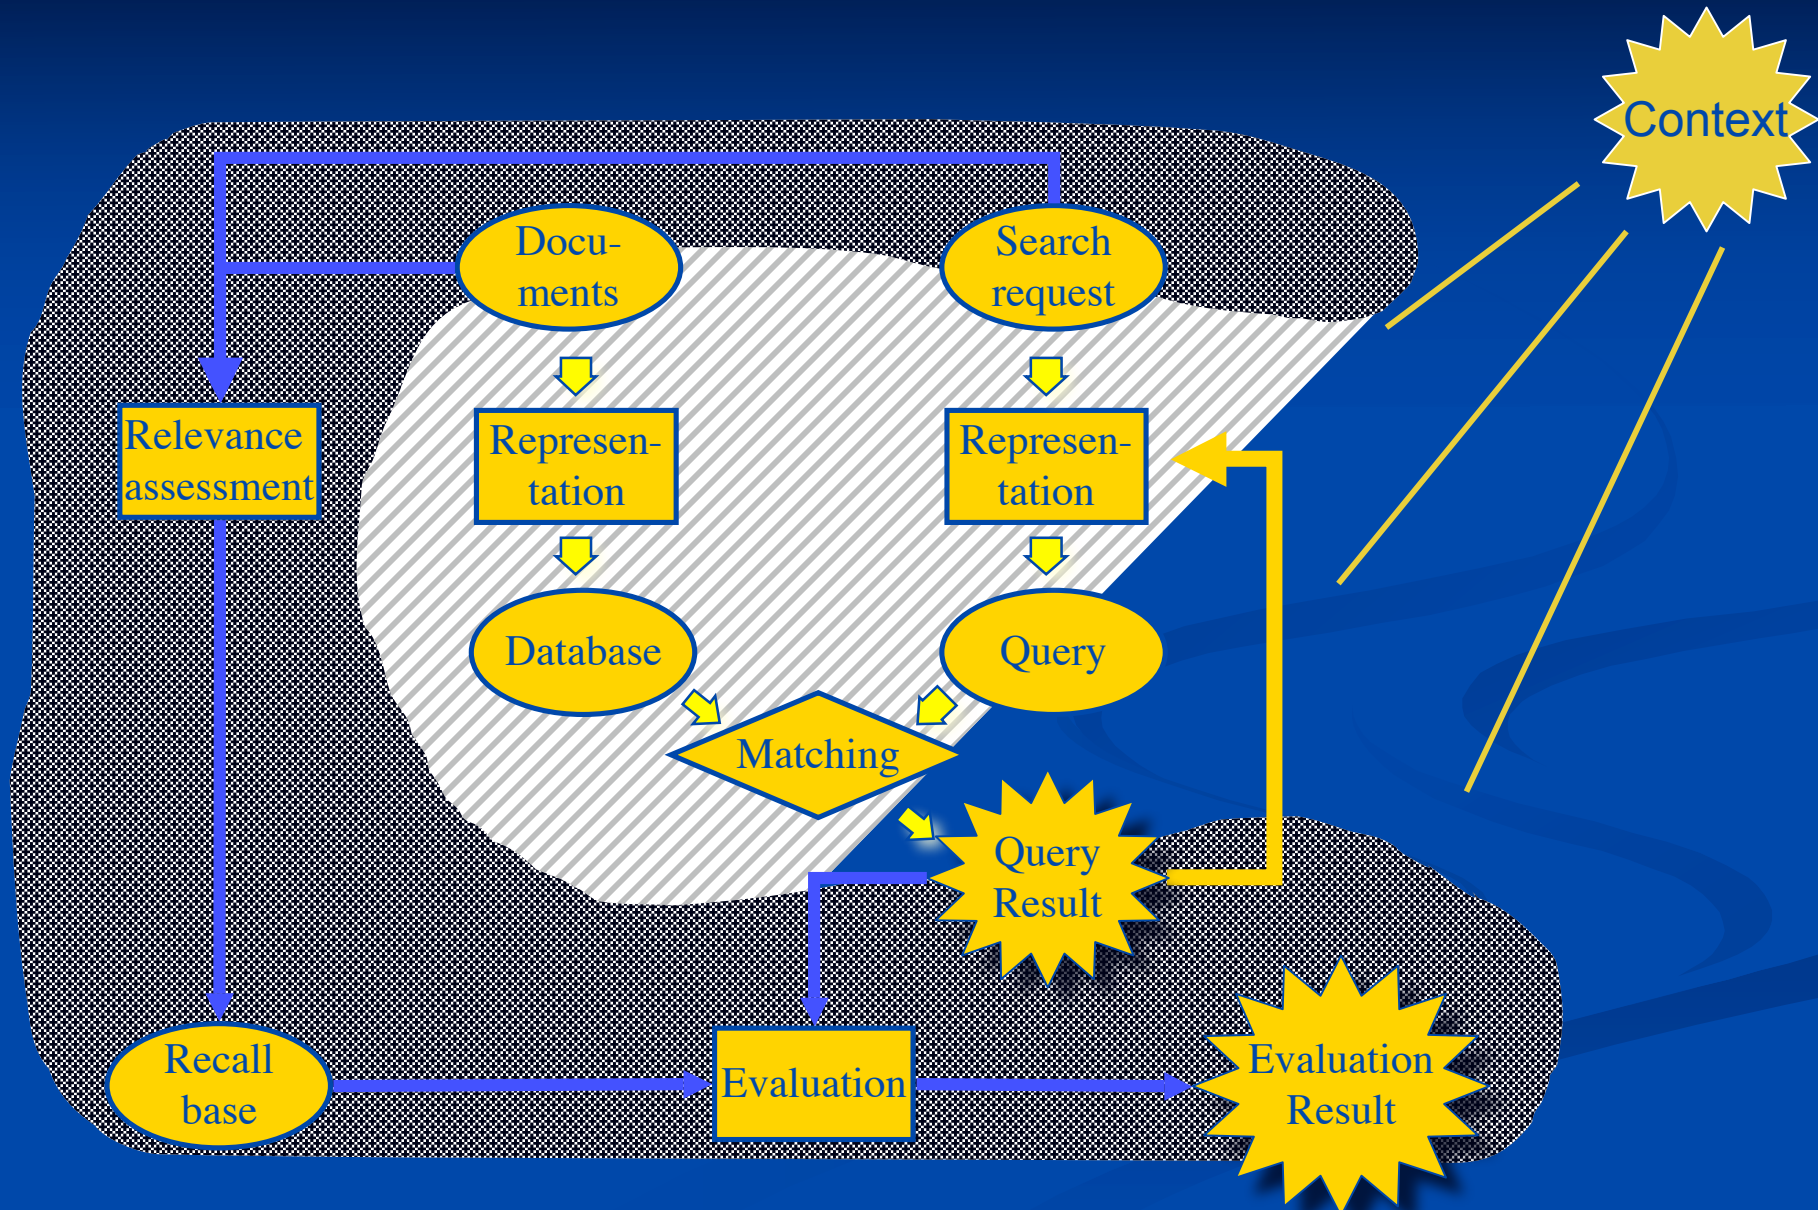

This is information retrieval, isn't it? But where is the lab?

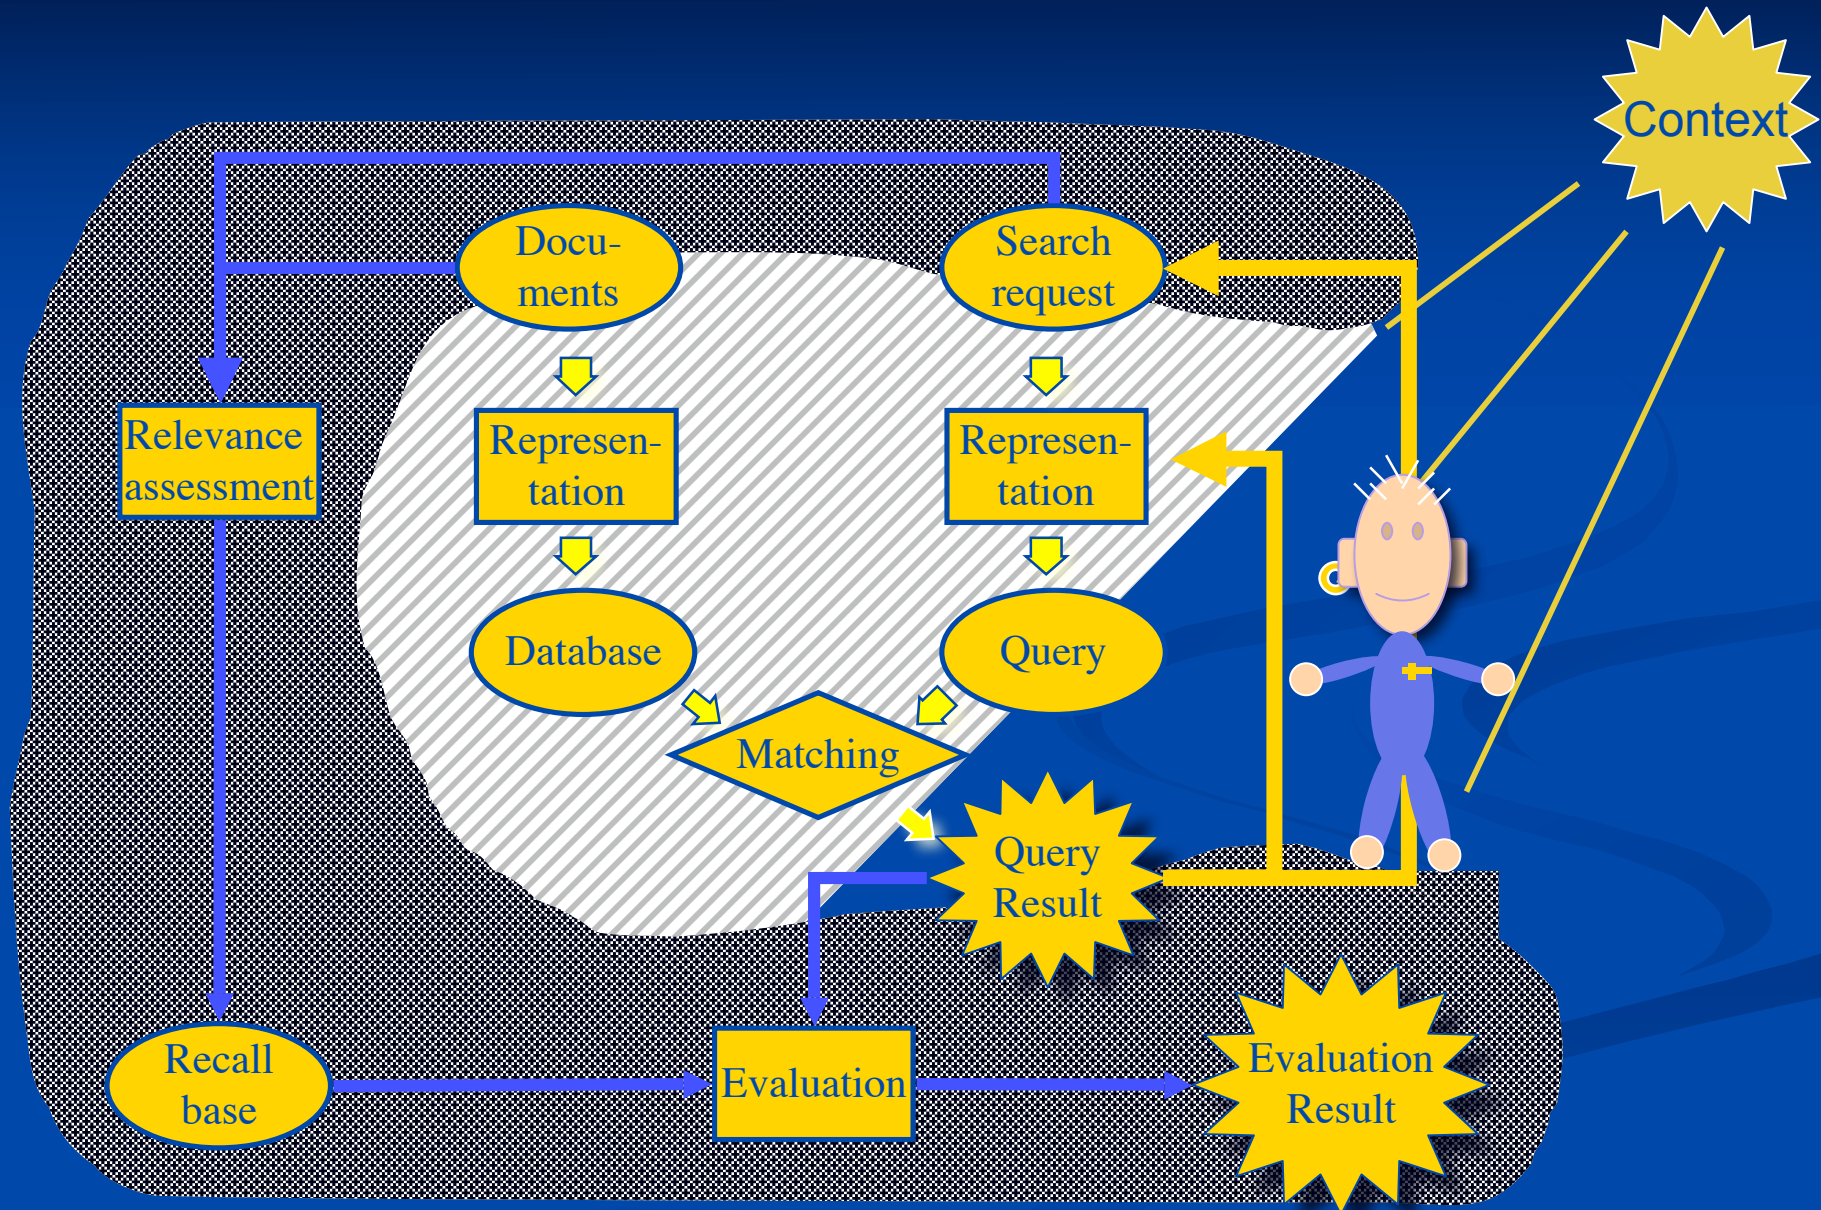

# The Lab Included – and User Dropped

# The Lab IR Cave

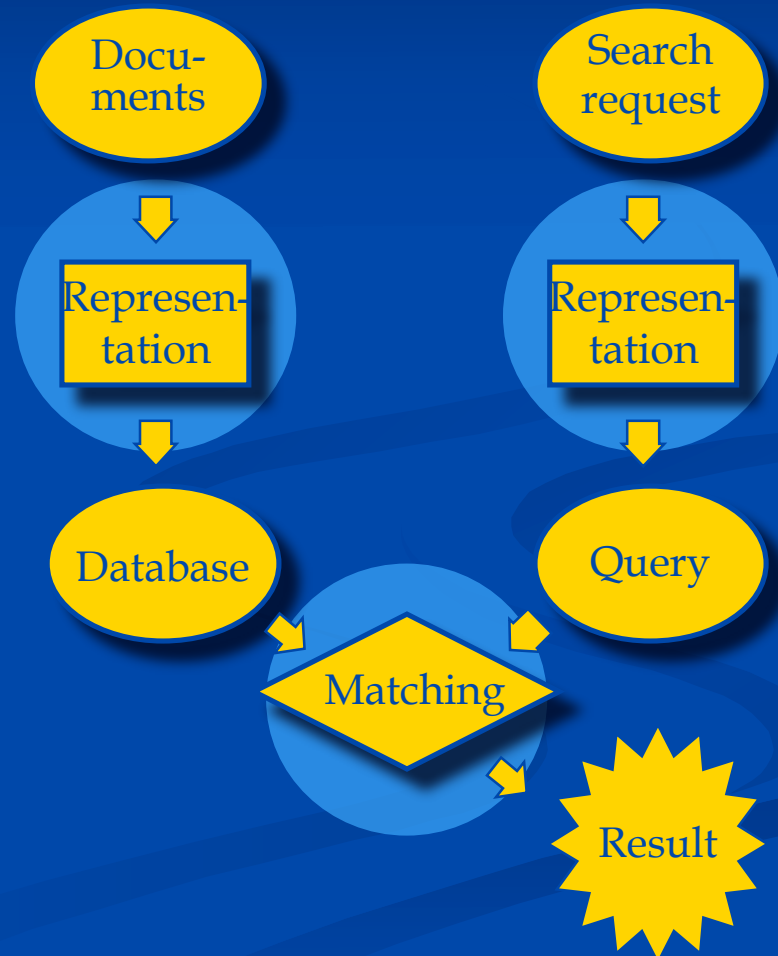

# The Lab IR Cave, with a Visitor

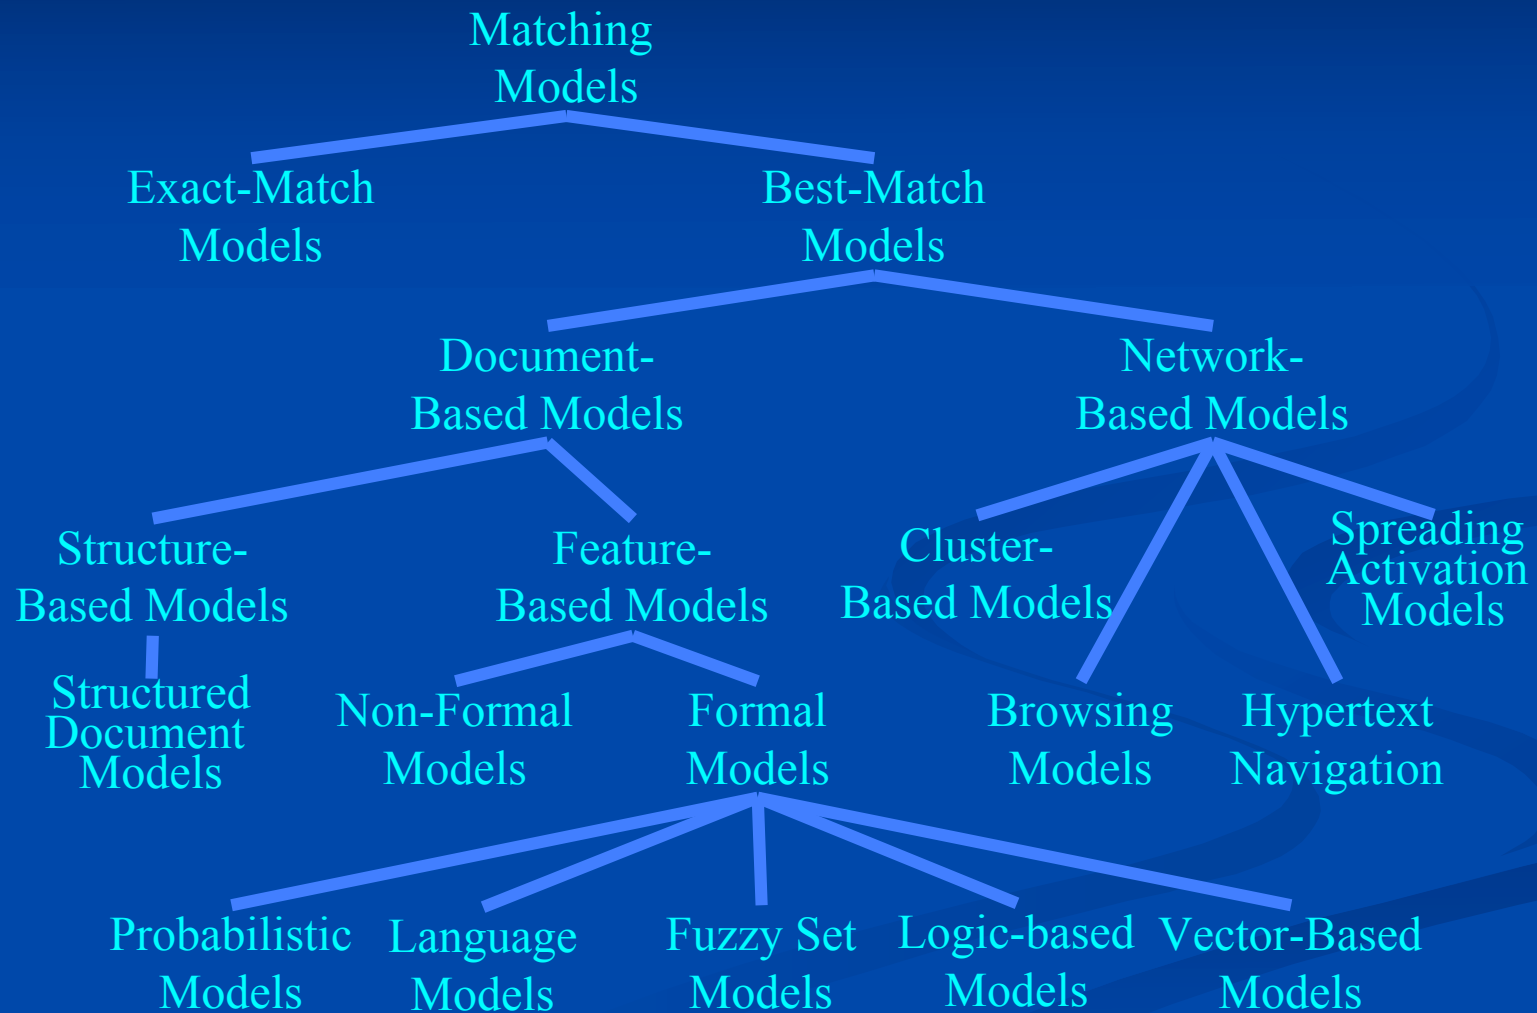

# Lab IR: The Model(s)

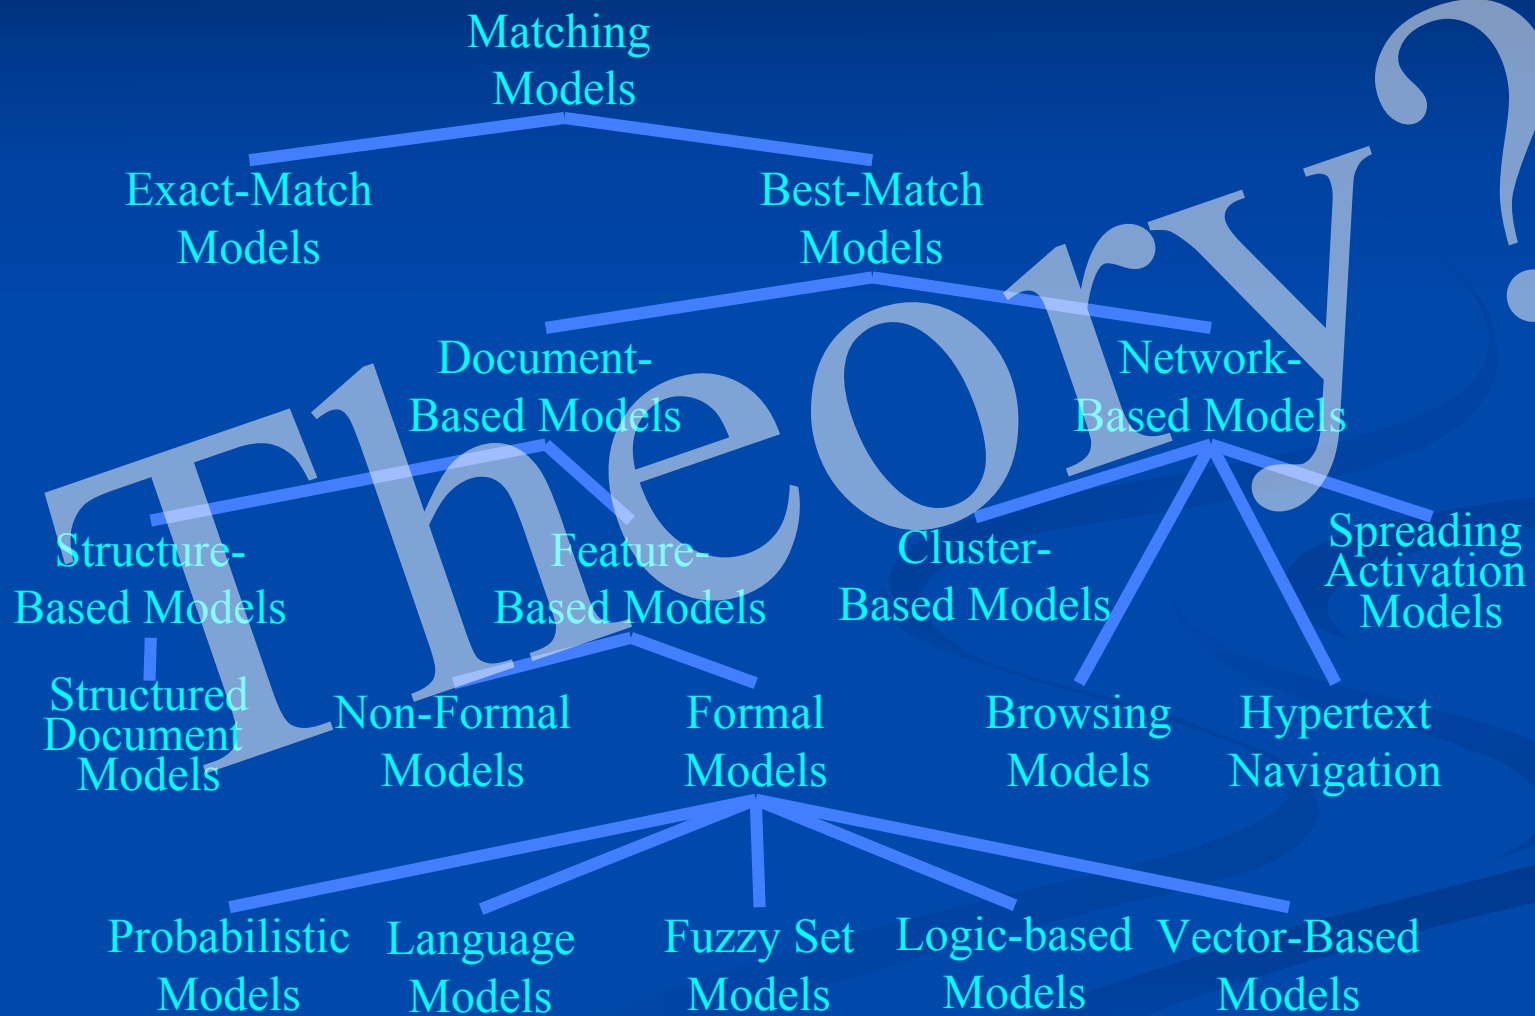

- Models in IR are retrieval models which specify
  - document and request representations, and
  - the matching algorithm for comparing these representations

# Lab IR: Models

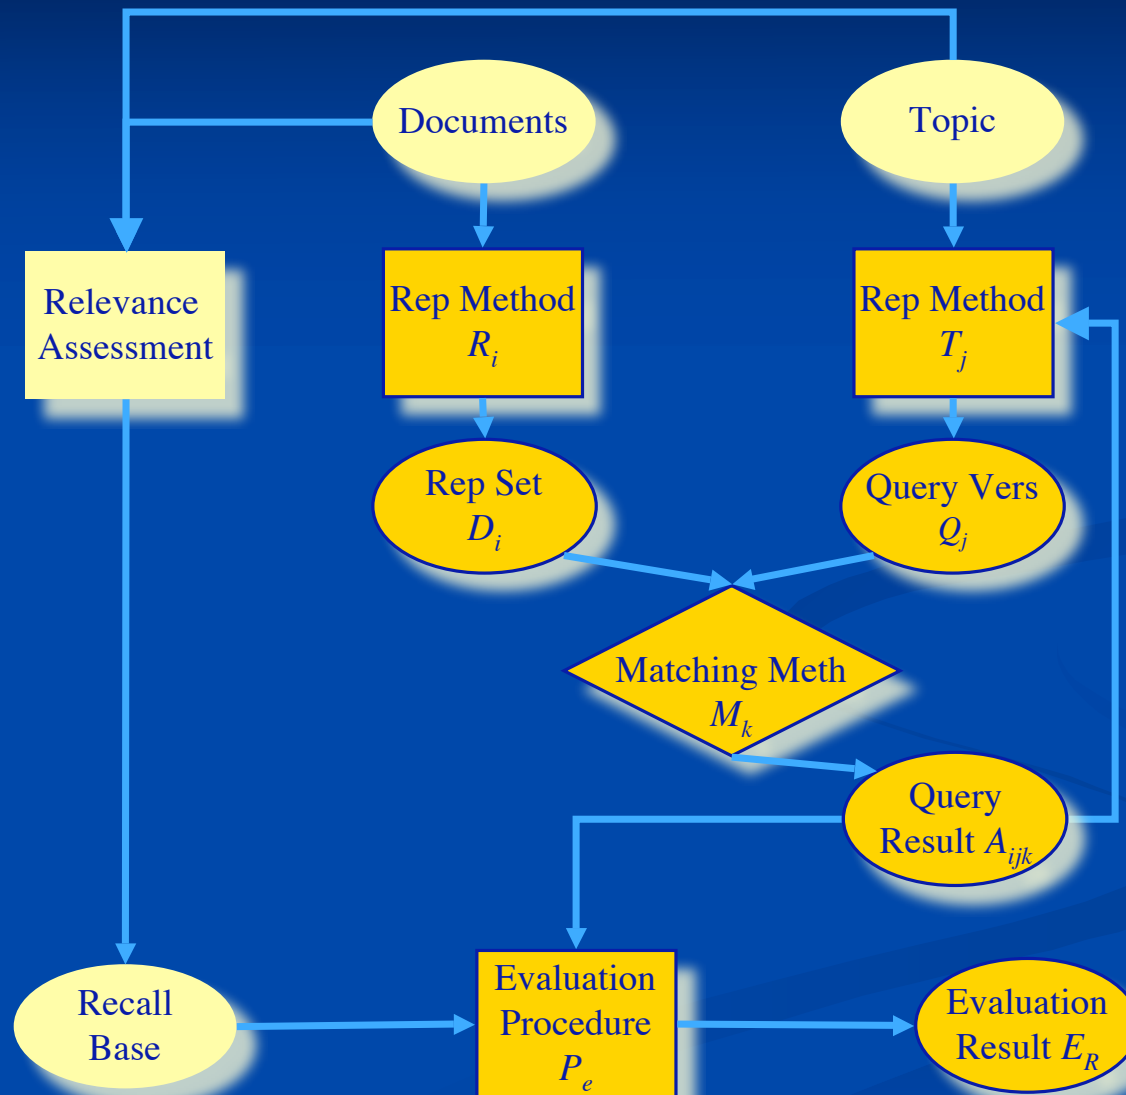

# Lab IR: Models

# The Laboratory Setting: Variables

# So What is Lab IR All About?

- Variables, Hypotheses, Laws, and Theories are about the explanation of **IR effectiveness**.
- The **dependent** variables typically are **recall** and **precision** or derived from them (e.g., MAP, nDCG).
- The explaining factors, the **independent** variables, are the use / non-use of selected **techniques** implementing retrieval models.
- The **controlled** variables are test collections, topics, assessments.
- There hardly are any **critical hypotheses** - cf. Physics

## ... All About?

- Strong standardization of the research designs facilitates comparison of results and has, admittedly, led to much progress in IR practice
- However, the strength and success of the approach may be a straightjacket.
- There is mounting evidence that the Lab IR approach may be ...

# ... Plato's Cave

# LabIR: Framework Issues

- W Y D S I W Y D U
  - Tasks
  - Searchers
  - Relevance assessments
  - Interface functionalities
  - Search processes
- C N C L ?

Top Fuel - Which one is better for real life?

# Agenda

- ✓ 1. Introduction
- ✓ 2. Some Concepts
- ✓ 3. The Laboratory Approach to IR
- 4. Mounting Critical Evidence on ...
  - information needs, relevance
  - system vs. user performance
  - sessions, systems integration
- 5. Cognitive Framework for Research on IIR
- 6. Conclusions

# Information needs, good queries?

- Articulated needs assumed in IR
- Kuhlthau (1994) and Byström & Järvelin (1995) have shown that sometimes there are no articulated information needs preceding information access.
- Embarrassment and confusion often present - Belkin's ASK (1982)

# Kuhlthau 1994

<b>Stages</b>	<b>Initiation</b>	<b>Selection</b>	<b>Exploration</b>	<b>Formulation</b>	<b>Collection</b>	<b>Presentation</b>
<b>Feelings</b>	Uncertainty	Optimism	Confusion, frustration, doubt	Clarity	Sense of direction, confidence	Relief, satisfaction or disappointment
<b>Thoughts</b>	Vague			Clearer	Increased interest	Focused
<b>Actions</b>	Seeking background information		Seeking relevant information		Seeking pertinent information	
<b>Appropriate tasks</b>	Recognize	Identify, investigate	Identify, investigate	Formulate	Gather	Complete

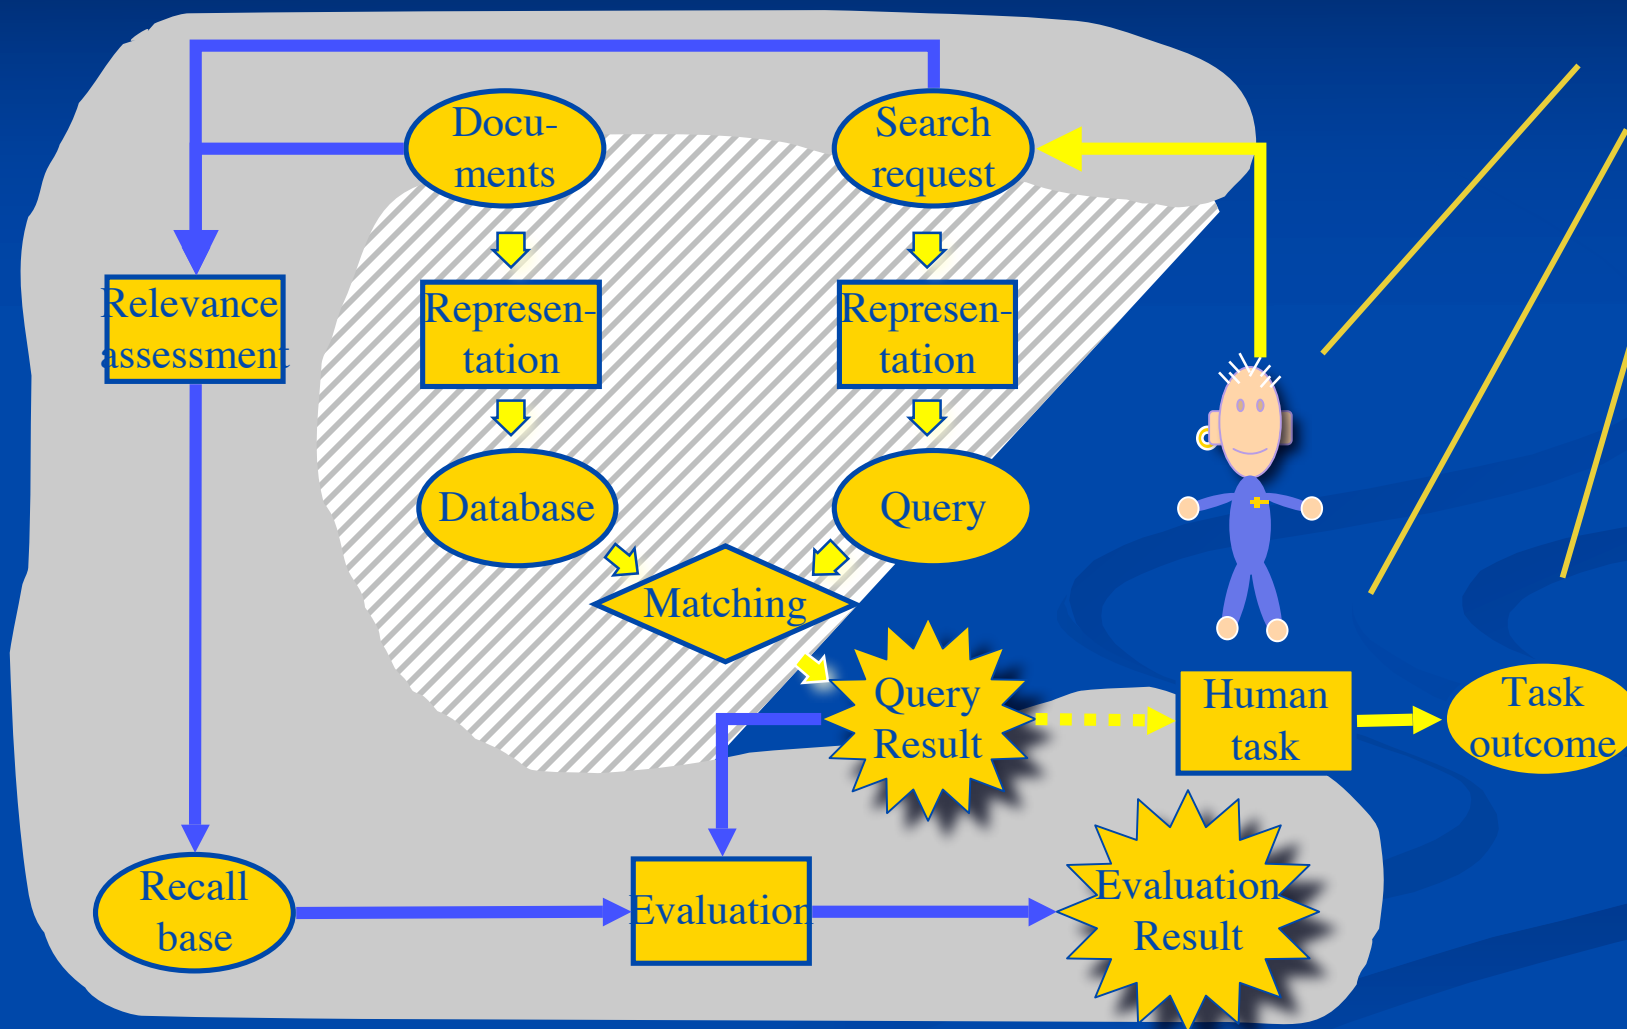

# Information needs, ..., relevance?

- Relevance
  - multiple degrees, multi-dimensional, individual
- ... depends on problem stage, difficulty, and information construction.
- Clicks perhaps not reliable predictors of relevance.

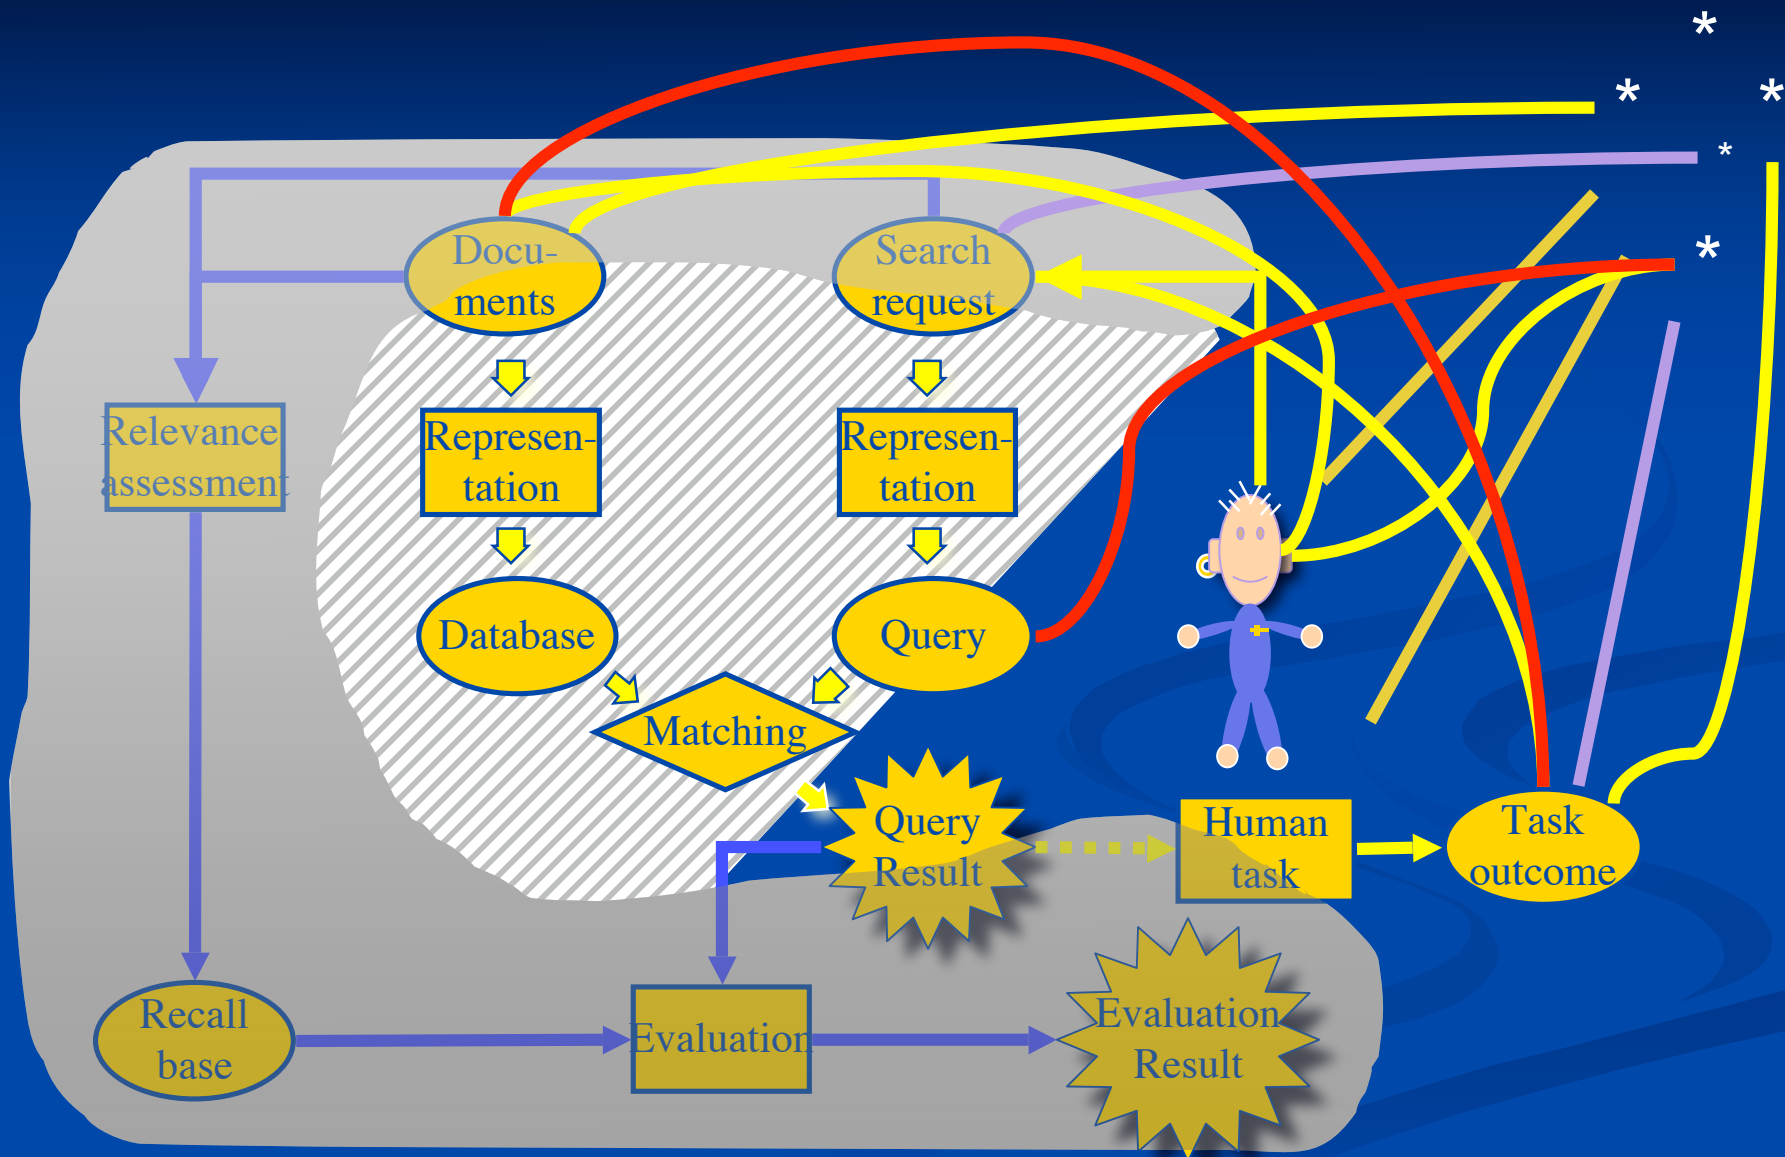

# What about human performance?

- Allan, Carterette & Lewis (2005) searcher productivity in a passage-based QA task
- Turpin & Scholer (2006) studied user performance on simple web search tasks
- Smith & Kantor (2008) explored the relation between system performance and searcher behavior
- ... all insiders we can rely on

# Exploring the outside...

... and all interactions ...

# Single shot

- A hunter having one cartridge in his shotgun ...

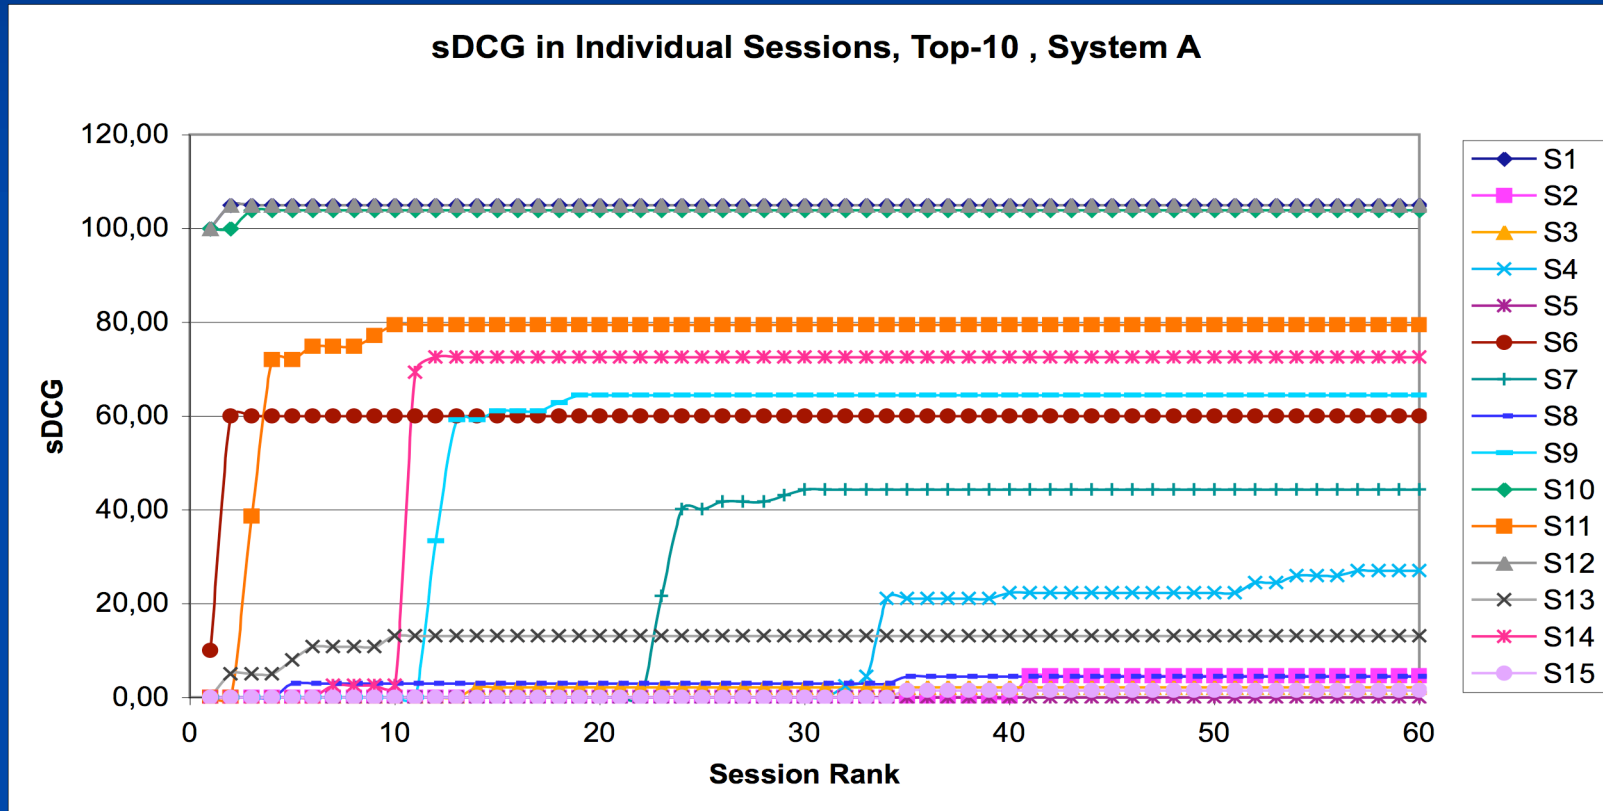

# Single shot vs. process

- Information retrieval processes have not been sufficiently described; therefore
  - they cannot be understood
  - they cannot be properly supported by IR techniques
  - they cannot be properly evaluated
- TREC IIR evaluation
- Session-based evaluation (Järvelin & al, 2008)

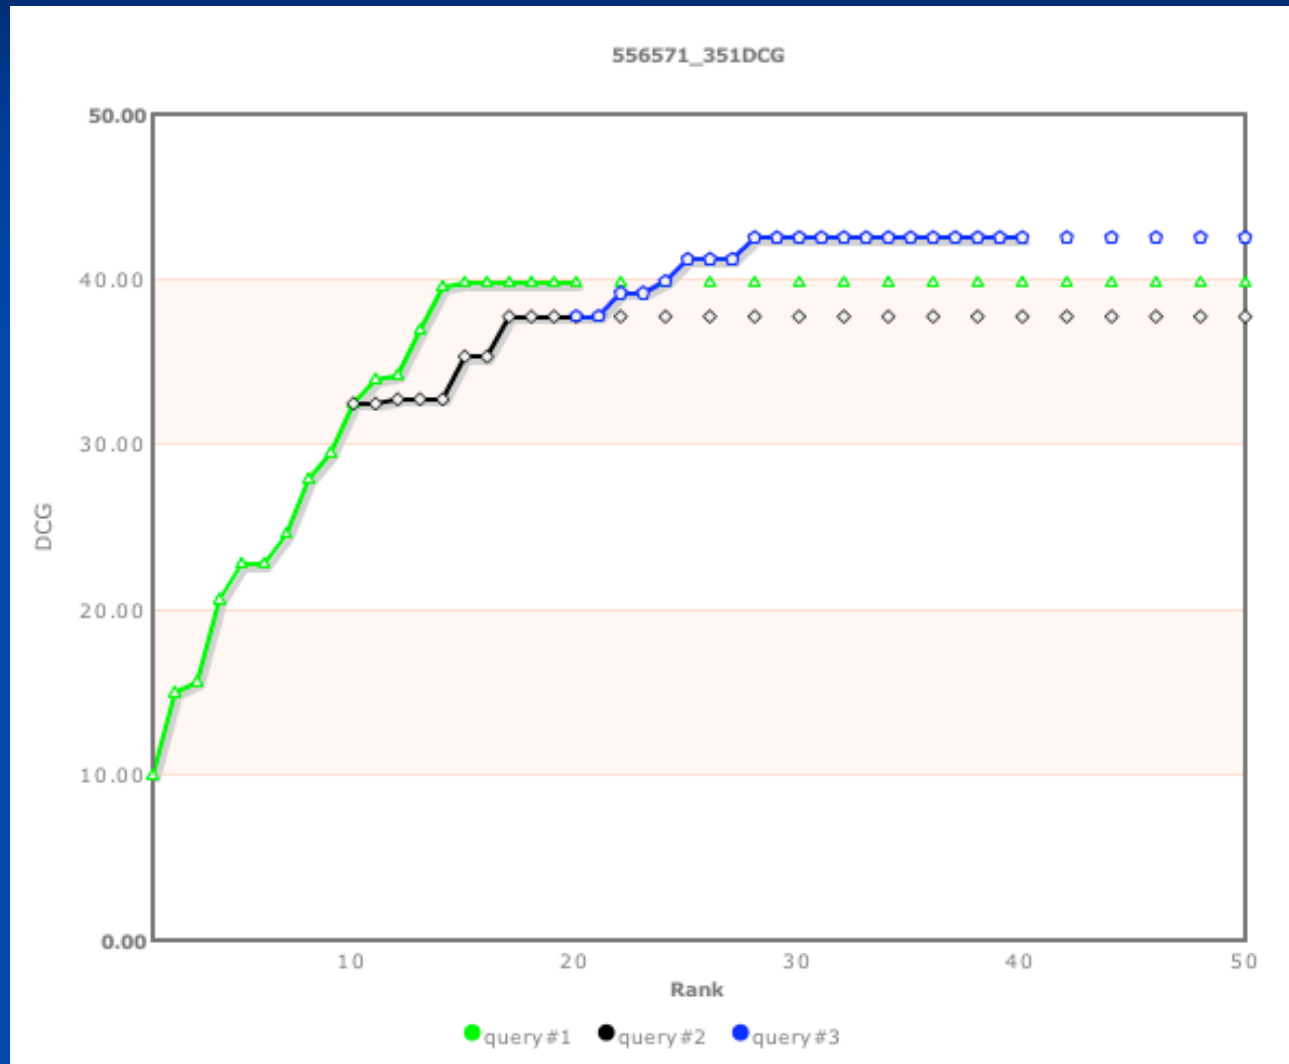

# session-DCG, individual queries

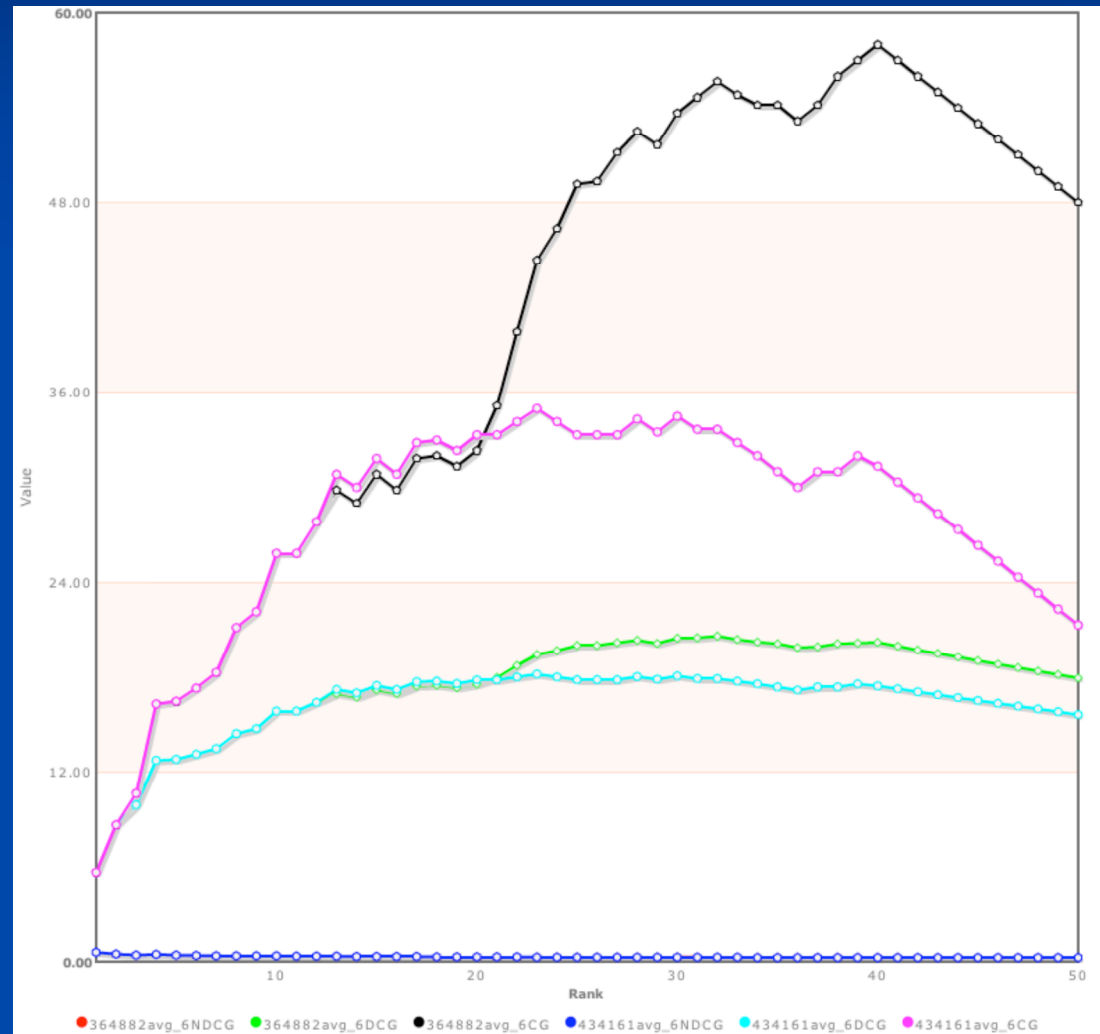

Individual sessions, Top-10, Systems A and B ( $b=2$ ;  $bq=4$ ; 0-1-10-100)

# s(D)CG Feedback Simulation

2, 2, 0-1-5-10

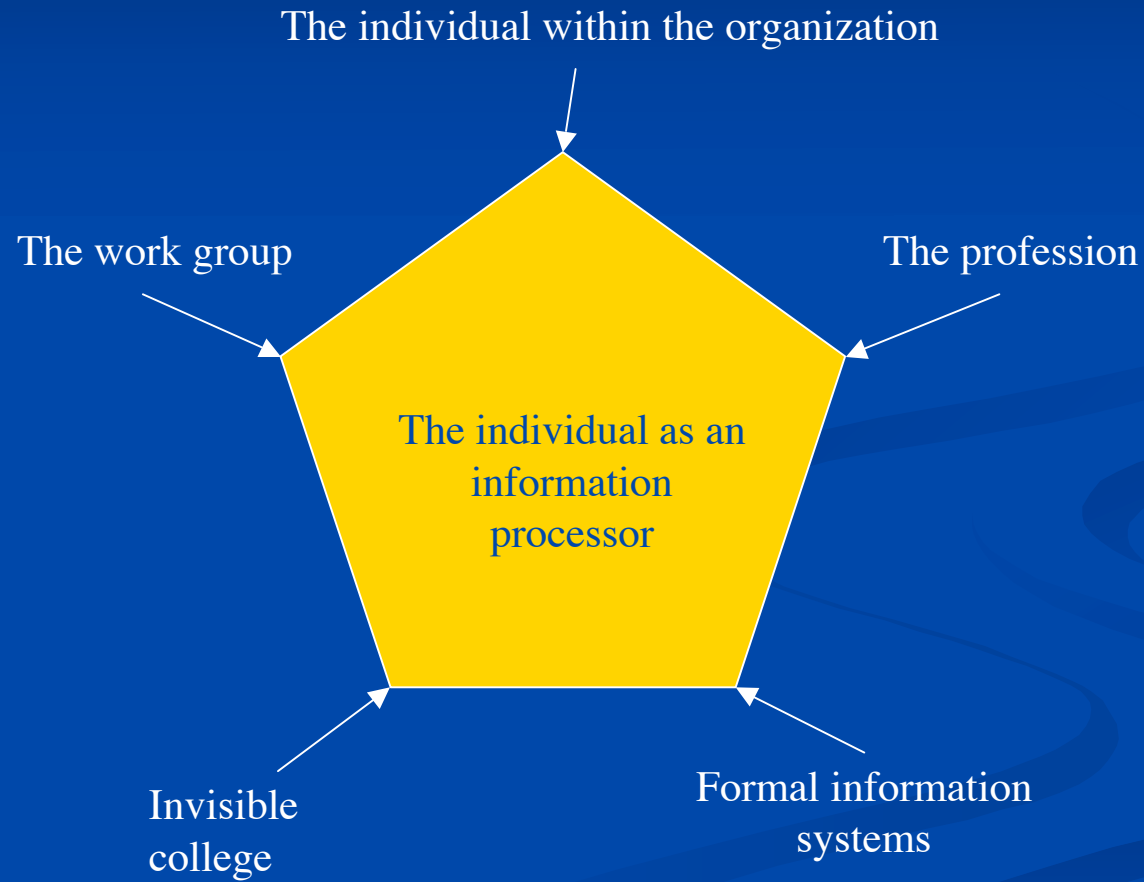

# s(D)CG Feedback Simulation

# IR in isolation?

- Information needs and seeking research in LIS in 1960's - 1980's - ARIST reviews
- Models vs. practice of research

# Allen's IS Model

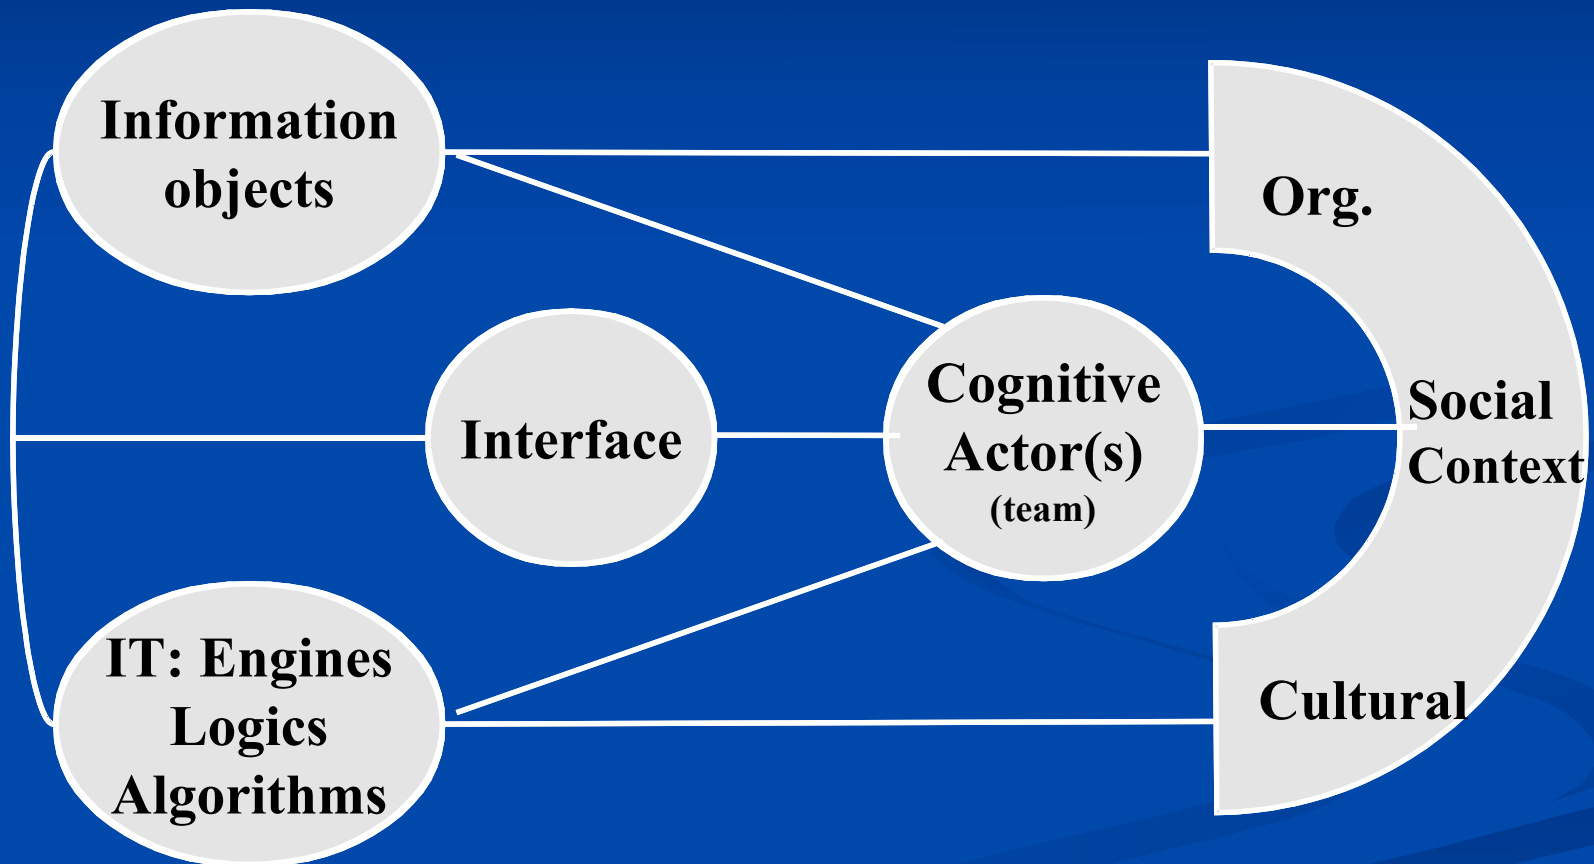

# IR in isolation?

- IR rarely is the user's main task
  - maybe just a pain in the neck
- The information environment
- IR is not performed in isolation in practice
  - often multi-source, multi-tool information environment
  - often IR integrated into other tools

# Agenda

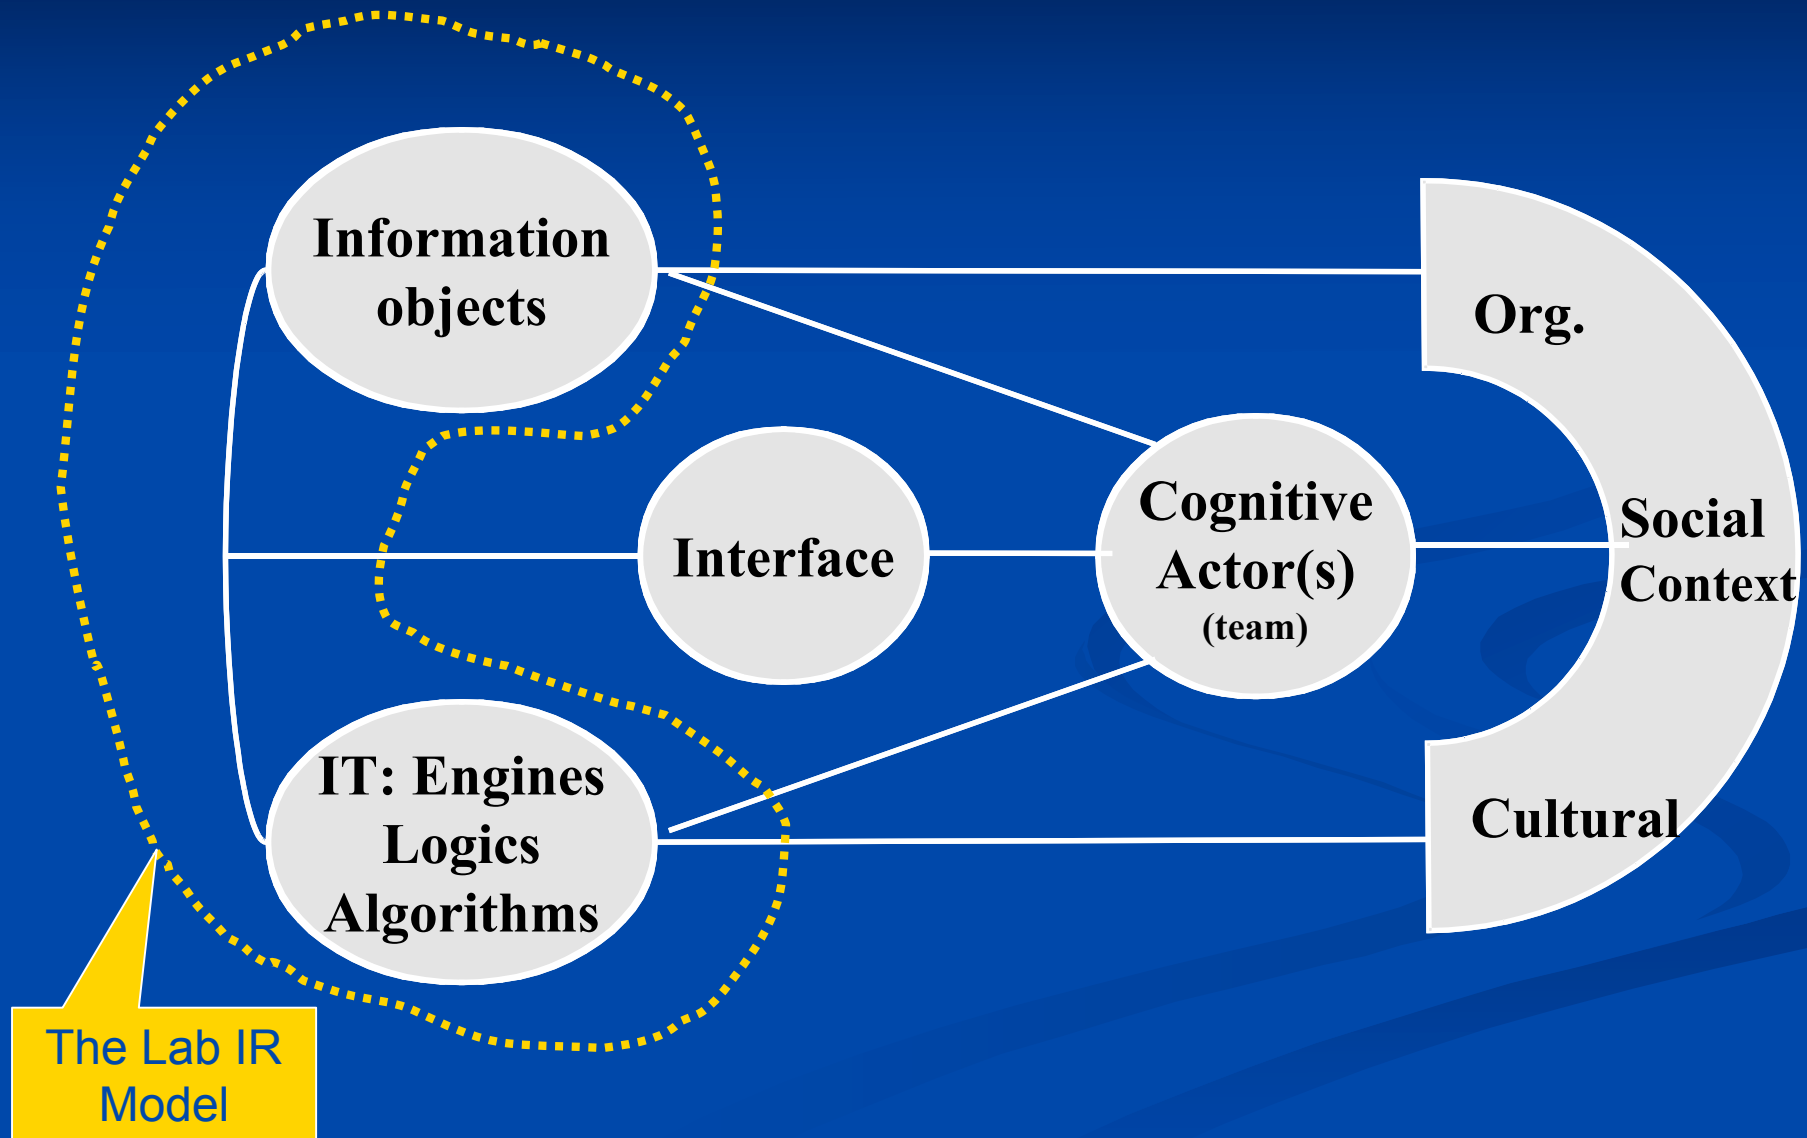

- ✓ 1. Introduction
- ✓ 2. Some Concepts
- ✓ 3. The Laboratory Approach to IR
- ✓ 4. Mounting Critical Evidence
- 5. Cognitive Framework for Research on IIR
- 6. Concluding Discussion

# A Cognitive Framework for IS&R

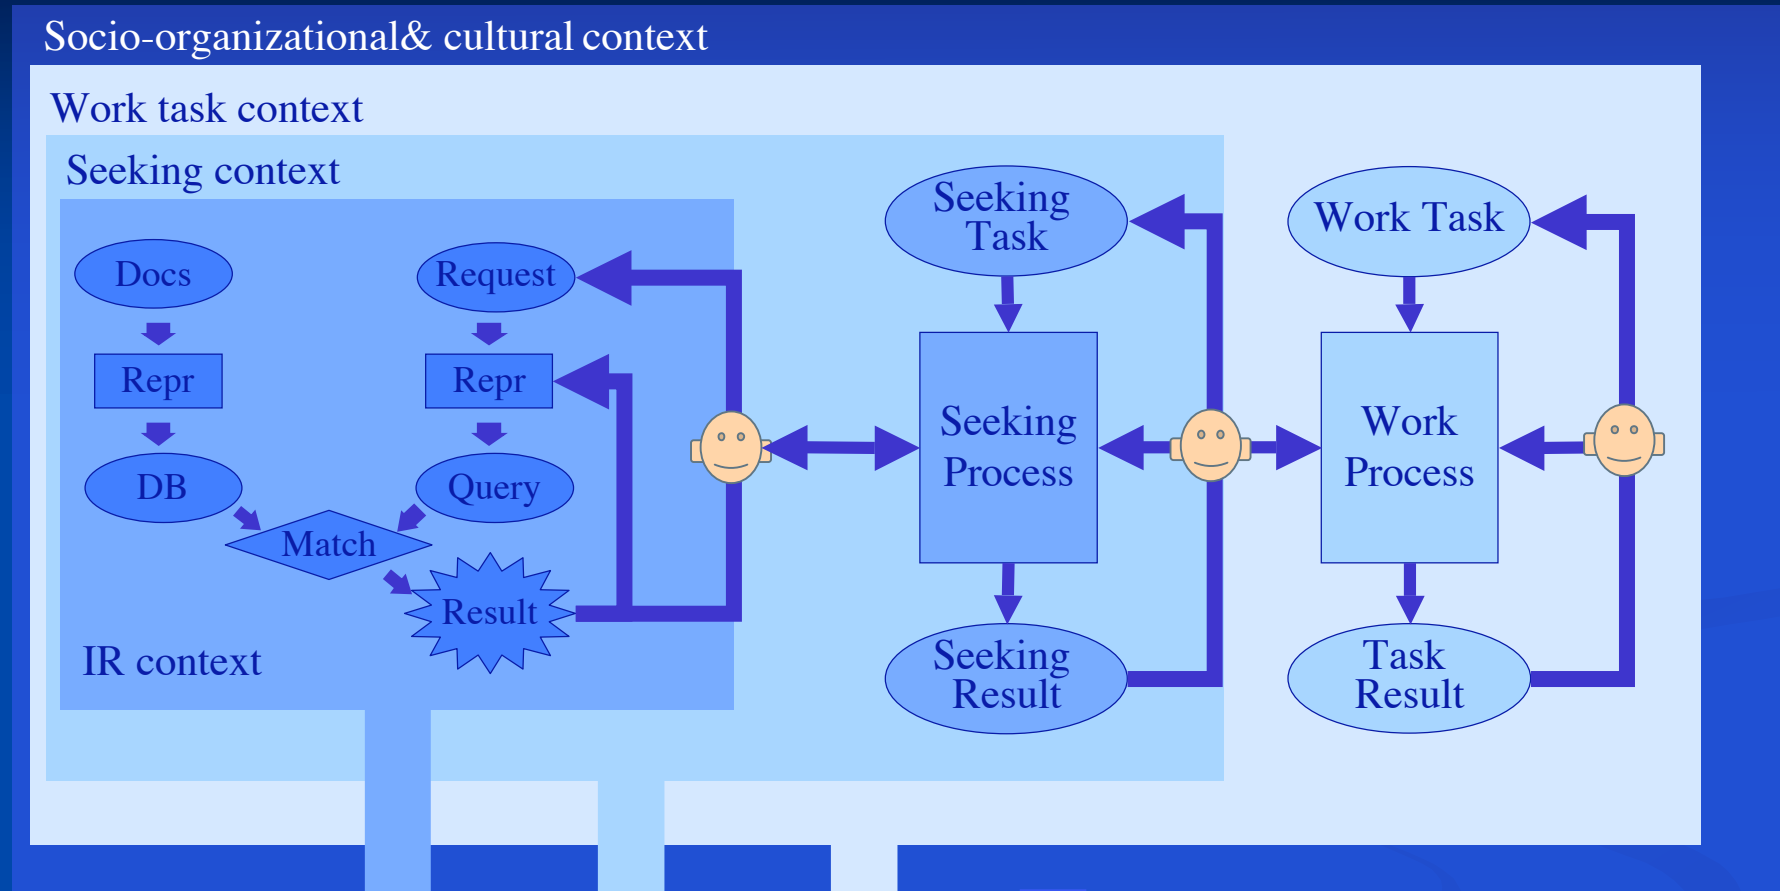

# A Cognitive Framework for IS&R

# The Applications of the Model

- Illustrating the roles of actors in a variety of cases of information behavior;
- Pointing to core components and information processes depending on (or influencing) such cases – i.e.,
- Pointing to kinds of context;
- Pointing out central variables involved in a variety of research designs – with a number of independent variables
- Pointing out new research questions and study designs

# Cognitive Framework and Evaluation Criteria

Evaluation  
Criteria:

A: Recall, precision, efficiency, quality of information/process

B: Usability, quality of information/process, learning

C: Quality of info & work process/result, learning

D: Socio-cognitive relevance; quality of work task result

# Lawn Mower?

# Cognitive Framework and Evaluation Criteria

Evaluation  
Criteria:

A: Recall, precision, efficiency, quality of information/process

B: Usability, quality of information/process, learning

C: Quality of info & work process/result, learning

D: Socio-cognitive relevance; quality of work task result

# Developing understanding

# Agenda

- ✓ 1. Introduction
- ✓ 2. Some Concepts
- ✓ 3. The Laboratory Approach to IR
- ✓ 4. Mounting Critical Evidence
- ✓ 5. Cognitive Framework for Research on IIR
- 6. Conclusions

# The Cognitive Research Framework Suggests

- Analyses of retrieval and access in different types of **collections**
- Analyses of various **actor types**
- Analyses of various **simulated task types** for experimental control or **real task types** for understanding real situations
- Analyses of **actor support** in search processes
